**SUPERVISOR: MRS IZAKPA GETTY
MARCH, 2026.**

CHAPTER ONE

INTRODUCTION

1.1 Background of the Study

The rapid advancement of Information and Communication Technology (ICT) has significantly transformed the way organizations manage data, communication, and administrative processes. In the educational sector, ICT has become a critical tool for improving efficiency, accuracy, and decision-making. Departments within higher institutions are responsible for managing essential data such as student records, staff information, and financial transactions. However, despite the availability of modern technologies, many departments still depend on manual or semi-automated systems, which are often inefficient, time-consuming, and prone to errors.

Student record management is one of the most sensitive and data-intensive operations in any academic department. It involves handling personal information, academic performance, enrollment history, and other critical data. Manual handling of such records can lead to duplication, data inconsistency, and difficulty in retrieving historical information when needed. According to Shelly and Rosenblatt (2018), traditional file-based systems lack the flexibility and reliability required for managing large datasets, thereby increasing the risk of data loss and inefficiency.

Similarly, staff record management plays a vital role in ensuring smooth departmental operations. Departments must keep track of staff qualifications, roles, teaching responsibilities, and service history. When these records are maintained manually, it becomes difficult to update information, monitor staff performance, and assign responsibilities effectively. Pressman and Maxim (2020) note that poorly managed information systems can hinder organizational productivity and lead to poor resource utilization.

In addition to student and staff records, financial management—particularly expense tracking—is a crucial aspect of departmental administration. Departments regularly incur expenses related to academic activities, maintenance, logistics, and other operational needs. When expense records are not properly managed, it can result in financial mismanagement, lack of transparency, and difficulty in auditing. Romney and Steinbart (2021) emphasize that an effective accounting information system is essential for ensuring accountability, accuracy, and proper financial reporting in organizations.

The limitations of manual systems, including slow processing speed, lack of real-time access, poor data security, and high susceptibility to human error, highlight the need for computerized solutions. Laudon and Laudon (2020) argue that digital information systems enhance organizational performance by enabling faster data processing, improved data accuracy, and better decision-making capabilities. Likewise, O'Brien and Marakas (2019) state that integrated information systems provide a centralized platform that supports data sharing, communication, and operational efficiency.

A web-based Departmental Management System (DMS) offers a comprehensive solution to these challenges by integrating student management, staff administration, and expense tracking into a single platform. Such a system allows authorized users to access, update, and manage information in real time, regardless of location. It also improves data security through authentication and access control mechanisms, while ensuring that records are properly stored and backed up.

Furthermore, the adoption of web-based systems aligns with the global trend toward digital transformation in education, where institutions are increasingly leveraging technology to enhance administrative and academic processes. By automating routine tasks and providing accurate and timely information, a Departmental Management System can

significantly improve productivity, accountability, and overall departmental performance.

Therefore, this study focuses on the design and implementation of a web-based Departmental Management System specifically tailored to manage student records, staff information, and departmental expenses efficiently and effectively.

1.2 Statement of the Problem

Many departments face significant challenges in managing student, staff, and financial records due to reliance on manual systems. These challenges include:

- i. Difficulty in storing and retrieving student and staff information
- ii. Loss or misplacement of academic and administrative records
- iii. Inefficient tracking of staff roles and responsibilities
- iv. Poor documentation and monitoring of departmental expenses
- v. Lack of transparency and accountability in financial records
- vi. High risk of errors and data inconsistencies
- vii. Time-consuming administrative processes

These problems reduce productivity, affect decision-making, and may lead to financial mismanagement. Therefore, there is a need for a computerized system that can efficiently manage these core departmental functions.

1.3 Aim and Objectives of the Study

The main aim of this project is to design and implement a Departmental Management System focused on managing student, staff, and expense records.

The specific objectives are to:

- i. Develop a system for storing and managing student information

- ii. Create a module for managing staff records and roles
- iii. Design an expense management system for tracking departmental spending
- iv. Ensure easy retrieval and updating of records
- v. Implement secure authentication and authorization mechanisms
- vi. Improve accuracy and transparency in departmental operations

1.4 Significance of the Study

This study is significant in the following ways:

- i. **Efficiency Improvement:** Reduces manual workload in managing records
- ii. **Data Accuracy:** Minimizes errors associated with manual record keeping
- iii. **Financial Accountability:** Enhances transparency in expense tracking
- iv. **Data Security:** Protects sensitive student and staff information
- v. **Better Decision-Making:** Provides reliable data for planning and management

The system will benefit departmental administrators, academic staff, and institutional management by improving record handling and financial monitoring.

1.5 Scope of the Study

This project focuses on the development of a web-based Departmental Management System with emphasis on:

- i. Student record management (biodata, academic details)
- ii. Staff record management (profiles, roles, responsibilities)
- iii. Expense management (recording, tracking, and reporting of departmental expenses)
- iv. User authentication and role-based access control

The system will be developed using PHP, MySQL, HTML, CSS, and XAMPP.

1.6 Limitations of the Study

The study may be limited by:

- i. Time constraints for full system development
- ii. Limited access to real financial and institutional data
- iii. Exclusion of advanced financial analytics features
- iv. Dependence on system availability (server or internet)
